

SAND MANAGEMENT SYSTEM™

The ultimate in ESP sand mitigation

SandGuard™ + Cyclone, the *essential*, over and under sand protection system for electrical submersible pumps (ESPs), for radically improved well performance.

Proven through hundreds of installations to become the new standard in ESP Performance enhancement.

In ESP pumped wells, dealing with sand is a big issue; especially in unconventional well completions where multi-stage fracking sand will flow back during production. ESPs commonly suffer from severe damage caused by frac sand and other residual solids that routinely cut short ESP performance.

Failure modes include pump erosion, sand accumulation, plugging, electrical and mechanical stresses and inability to bring the well back on after a shutdown.

Multilift's field proven Sand Management System™ is the ultimate, proactive sand management strategy vital to protect the ESP and keep production flowing smoothly.
